

2023/2024

Substations & Smart Grid

page 4

System requirements:

- Compliance with IEC 61850-3, ensuring the best EMI shielding and communication without error
- Communication redundancy: ERPS and compatible Ring, STP/RSTP/ MSTP/Master/Client
- Fiber optic uplinks for long-distance transmission, noise resistance, and huge bandwidth for upgrading
- Wide range of temperature support
- IEEE 1588 support for precision timing
- Highest network availability in compliance with HSR/PRP
- Security features based on IEC 62443

ATOP solutions:

- EH97xx
- •RHG95xx
- EHG95xx
- •RHG96xx
- EHG96xx
 - •RHG97xx •RHG98xx

Industrial Automation & Process control

System requirements:

- RSTP/ERPS and other ring topologies for network redundancy
- Wide range of operation temperature support
- Profinet CC-B certified (EHG7504/08, EH75xx)
- Redundant power supply
- Level-3 EMC protection
- IP30 metal housing with DIN-Rail /wall mount (optional)
- Security features based on IEC 62443 (managed switch)

ATOP solutions:

- EH(G)20xx
- EHG73xx
- EH(G)3005
- EH(G)75xx
- EH(G)23xx
- EHG76xx

- EH(G)33xx
- EMG8305
- EH3408

- EMG8xxx
- EHG64xx
- RHG76xx
- EHG65xx
- NSG33xx

Smart City

page 12

System requirements:

- PoE bt/at/af support
- RSTP/ERPS and other ring topologies for network redundancy
- Redundant power supply
- Level-3 EMC protection
- Security features based on IEC 62443

ATOP solutions:

- EHG2408
- EH(G)75xx
- EHG64xx RHG7xxx
- EHG65xx EHG76xx
 - EHG77xx

Railway & Transportation

— page 16

System requirements:

- PoE at/af support
- IP67 or IP30 enclosure
- EN50155 & IEC60571 for rolling stock certificated
- EN50121-4 for trackside certificated
- EN45545-2 for fire protection
- NEMA TS-2 & E-Mark certificated for traffic control applications
- Security features based on IEC 62443

ATOP solutions:

- EHG73xx
- RHG76xx
- EHG75xx
- EMG83xx
- EHG76xx • RHG75xx
- EMG85xx

Oil & Gas

_____ page 22

System requirements:

- UL Class 1 Division 2 ATEX
- Wide range of operation temperature support

ATOP solution:

• EHG73xx

Substations & Smart Grid

Industrial Networking Solutions for the Power Industry

Over the years, different standards for the utility communication protocols used in power grid networks have been developed and adopted across the world. DNP 3 has become the preferred standard in North America, enabling open, standard-based interconnectivity. In Europe, IEC 60870-5 101/103/104 is widely used for sending and receiving values with time stamps and performing other commands. Meanwhile, the rest of the world has predominantly used Modbus protocol for data exchange of one-bit binary registers or 16-bit registers. To overcome the barriers caused by different protocols, the International Electrotechnical Commission (IEC) developed IEC 61850, which provides a standard communication protocol for electrical substations and power grid automation.

IEC 61850 uses a data modeling scheme to clearly describe each component of a power grid or substation as standard logical nodes. This object-oriented protocol enables integration of all protection, control, measurement, and monitoring functions, providing detailed data access to the power grid system. Additionally, IEC 61850 Part 3 specifies the hardware and network suitability requirements, such as electromagnetic immunity (EMI), surge protection, vibration and shock resistance, and temperature range in which devices must function.

Another important aspect of substation networks is cybersecurity—the consequences of a data breach for critical infrastructure are too high. ATOP IEC 61850 switches are IEC 62443 compliant, offering mind-relieving features like 802.1x access control, AAA, ACL, IP Source Guard, and network monitoring. They ensure reliability, availability and optimal performance in power grid networks.

IEC 61850-3 Device Compliancy Specifications require the device to:

- a. Operate in a temperature range from -40°C to 75°C.
- b. Be capable of reliably handling long-distance transmissions through fiber optic connectivity.
- c. Guarantee QoS (Quality of Service) management and real-time packet switching for GOOSE event messages.
- d. Support IEEE1588 Precision Timing Protocol (PTP) requirements for power grid networks.
- e. Guarantee a level of redundancy that minimizes packet loss. Ring topologies should be supported, and zero-packet-loss technologiessuch as HSR (High availability Seamlessly Redundancy) or PRP (Parallel Redundancy Protocol) are strongly recommended to be supported. ATOP's devices support RSTP (Rapid Spanning-Tree Protocol) and ERPS rings. When equipped with HSR/PRP modules, our innovative RHG9528/RHG9628 switch can guarantee no loss of GOOSE packets.
- f. Support MMS server for unified management.
- g. Have a wide tolerance for vibrations and shocks. ATOP offers a range of devices with full MIL-STD-810F compliance.
- h. Have tough electromagnetic immunity and comply with emission standards.
- i. Have at least Level 3 EMC protection; have at least Level 4 ESD, EFT and Surge protection; and have at least Level 5 PFMF and Damped Oscillatory Magnetic Field immunity.

Industrial Automation & Process Control

Entry level

ATOP offers reliable, cost-effective unmanaged switches for simple network topologies in harsh environments. IP30-rated and certified for Industrial EMC (EN61000-6-4 and EN61000-6-2), they comply with FCC, TUV, UL, and CE standards. Housing comes in plastic, steel, or aluminum to suit different industrial environments, with plastic allowing operation temperatures from 0°C to 60°C and metal achieving -10°C to 70°C. All switches have redundant power supplies and offer 4 to 8 Fast Ethernet or Gigabit Ethernet ports. Fiber optic uplinks and PoE ports are also available on select models.

For networks that require just a bit more management and insight, lite-managed switches offer key functions like redundancy and diagnosis. With wider applications than unmanaged switches, they represent very good value for money.

Advanced features

ATOP's managed switches are designed to support demanding networks and environments, featuring 4 to 28 Fast Ethernet, Gigabit or 10 Gigabit ports, wide operating temperature range, PoE/PoE+ ports, and more. Selected products have MIL-STD shock and vibration certification, operating ranges as wide as -40°C to 75°C, and Profinet CC-B v2.33 certification, making them IoT ready.

ATOP layer 2 managed switches focus on reliable performance in harsh industrial environments, supporting advanced network management with features like redundancy protocols, precision time synchronization, and efficient network management through various interfaces. Layer 3 switches are ideal for scaling industrial networks or large surveillance applications, supporting IPv4 static routing, BGP, RIP/RIPv2, OSPFv2, and multicast protocols. The NAT switch provides a means to change the header of IP packets and simplifying topologies. Slim type switches are valuable in space-limited applications.

Security-conscious

In today's world of increasing cyber incidents, it is crucial to ensure that network devices comply with the technical requirements of the IEC 62443 standard. This involves implementing enhanced component-level protection and mechanisms to manage device security.

Smart Cities

Enabling Reliable Communications for Infrastructure, Surveillance, and Smart Buildings

As cities continue to grow and evolve, the demand for more efficient and sustainable services increases. Smart cities are a response to this demand, with the goal of using technology to enhance urban infrastructure, services, and quality of life.

Smart city networks play a crucial role in a city's communication and data exchange needs. ATOP smart city solutions are scalable and flexible to accommodate the changing needs of a smart city. Compliance with industry standards and regulations, such as the IEEE 802.1 standards, allows interoperability and compatibility with other devices. PoE ports are available for easy, cost-effective installation and maintenance. Especially with the development of high-performance surveillance cameras, 802.3bt support for higher PoE power supply are necessary for widespread use. Fast Ethernet, Gigabit Ethernet, and even 2.5G or 10G speeds provide reliable, rapid data transmission with low latency. Wide operating temperature ranges and rugged hardware alleviate the risk of failure in harsh environments, while ring support facilitates quick recovery in case of accidents.

Last but not least, a range of security features, including encryption, authentication, and access control, ensure the confidentiality, integrity, and availability of data.

Railway & Transportation

Industrial Networking for Railway and Public Transportation

Railway and Trackside Made Easy

Industrial Networking for Railway transportation

Network devices on trains must meet certain criteria such as for environmental, shock, power supply, vibration, humidity, electromagnetic interference, wide temperature range, EMC, power surge, electrostatic discharge (ESD), and transient factors.

EN 50155 is an internationally-recognized standard for electronic equipment used in railway applications. EN50121-4 defines standards for ground equipment. ATOP's railway-certified switches comply with both EN50155 and the essential sections of EN50121-4, while also offering advanced features like redundancy and precision timing. Enclosed in robust and reliable housing, they are highly suitable for use in signal control networks and on-board applications.

Temperature Requirements

Class	Ambient Temperature Outside Vehicle	Internal Cubicle Temperature	Internal Cubicle Over-Temperature Within 10 Min.	Air Temperature Surrounding the Printed Board Assembly
T1	-25°C to +40°C (-13°F to +104°F)	-25°C to +55°C (-13°F to +131°F)	+15°C (+59°F)	-25°C to +70°C (-13°F to +158°F)
T2	-40°C to +35°C (-40°F to +95°F)	-40°C to +55°C (-40°F to +131°F)	+15°C (+59°F)	-40°C to +70°C (-40°F to +158°F)
Т3	-25°C to +45°C (-13°F to +113°F)	-25°C to +70°C (-13°F to +158°F)	+15°C (+59°F)	-25°C to +85°C (-13°F to +185°F)
Т4	-40°C to +50°C (-40°F to +122°F)	-40°C to +70°C (-40°F to +158°F)	+15°C (+59°F)	-40°C to +85°C (-40°F to +185°F)

Public Transportation and Traffic Control

Industrial Networking for ITS

Intelligent Transportation Systems (ITS) are advanced systems that use modern technologies to improve the efficiency and safety of transportation systems, and building a strong networking system for ITS is crucial in ensuring the effectiveness of these systems.

ITS networks must be scalable and interoperable to support seamless communication between different devices and more as the system grows. They need reliability and low latency to ensure real-time performance, even in adverse conditions. Finally, redundancy and cybersecurity keep the system running through cyberattacks or partial failure.

ATOP's NEMA TS2 range is certified for the high/low temperature, high humidity, vibration, and mechanical shock requirements of ITS and traffic control. Certain devices also comply with DNV.GL for marine applications as well.

Oil & Gas

Guaranteeing safety in hazardous environments

The oil and gas industry requires components that can withstand harsh and dangerous environments. These environments are often full of flammable gases, liquids, vapors, and combustible dusts, which makes safety a top priority. Even a small spark can cause a catastrophic event, so any device deployed in these environments must be highly reliable, safe, and perform well. Utilizing non-sparking components is the best way to ensure safety.

ATOP's hazardous series solutions are UL Class I Division II and ATEX certified, with no normally arcing parts that may pose danger in hazardous environments. They can be deployed in hermetically sealed hazardous or explosive conditions without increasing the risk of an explosion, and in case of an accident, will not accelerate the damage.
